

Vaidio AI Model fairness and Bias Compliance Policy

January 2025

This statement defines Vaidio's approach to ensuring fairness, mitigating bias, and supporting responsible use across all AI and machine learning models developed and deployed by the company.

1. Scope

This policy applies to:

- All AI/ML models developed, deployed, or maintained by Vaidio
- All stages of the AI lifecycle, including data collection, training, validation, deployment, and monitoring
- All customer deployments, including public-sector, enterprise, and academic use cases

2. Fairness and Non-Discrimination Principles

Vaidio AI systems are designed to:

- Avoid unlawful discrimination or systematic disadvantage to individuals or groups
- Promote equitable performance across relevant populations and operational contexts
- Support human decision-making rather than fully autonomous decision-making in high-impact scenarios
- Maintain clear accountability for model behavior and outcomes

3. Data Governance

3.1 Data Quality and Representativeness

- Training and evaluation datasets are assessed for relevance, representativeness, and known limitations
- Dataset provenance and usage constraints are documented where applicable

3.2 Sensitive Attributes

- Models are designed to minimize reliance on sensitive or protected attributes unless legally permitted and explicitly required

- Customers retain control over data selection, ingestion, and retention policies

4. Model Development and Validation

- Models undergo pre-deployment testing to assess performance consistency across relevant conditions
- Bias and performance risks are evaluated using appropriate quantitative and qualitative methods
- Model behavior, limitations, and intended use are documented to support auditability and transparency

5. Human Oversight and Responsible Deployment

- Vaidio AI systems are intended to augment, not replace, human judgment
- Customers are responsible for implementing appropriate human oversight, particularly for high-risk or regulated use cases
- Vaidio provides technical documentation and deployment guidance to support responsible use

6. Monitoring and Lifecycle Management

- Deployed models are monitored for performance drift, bias, and unintended effects
- Identified risks may result in model updates, retraining, configuration changes, or decommissioning
- Continuous improvement processes are informed by operational feedback and review

7. Regulatory Alignment

Vaidio's AI fairness practices are designed to align with applicable laws, regulations, and recognized frameworks, including:

- Data protection and privacy regulations
- Public-sector and enterprise AI governance requirements
- Emerging AI risk management and ethical AI standards

8. Transparency and Customer Support

- Vaidio provides clear disclosures regarding AI system capabilities, limitations, and intended use

- Customers are supported in conducting their own fairness, bias, and impact assessments
- Configurable system controls enable alignment with jurisdictional and institutional requirements

10. Governance and Review

- AI fairness and bias considerations are integrated into Vaidio's internal governance and risk management processes
- This statement is reviewed periodically and updated to reflect regulatory developments and best practices

Appendix A: AI Fairness & Bias Procurement Compliance Summary

Product Scope: AI/ML-based video analytics and related AI systems

A. Governance & Accountability

- ☐ AI fairness and bias mitigation integrated into product development lifecycle
- ☐ Documented ownership for AI governance and compliance
- ☐ Periodic internal review of AI risks and controls

B. Data Governance

- ☐ Assessment of training and evaluation data for quality and representativeness
- ☐ Documentation of known dataset limitations and constraints
- ☐ Data minimization practices applied to sensitive attributes
- ☐ Customer control over data ingestion, configuration, and retention

C. Model Development & Testing

- ☐ Pre-deployment testing for performance consistency
- ☐ Bias and disparate impact risks evaluated using appropriate methods
- ☐ Model limitations and intended use documented

D. Human Oversight

- ☐ AI systems designed to augment human decision-making
- ☐ No fully autonomous decision-making in high-risk contexts by default
- ☐ Deployment guidance supports human-in-the-loop workflows

E. Monitoring & Lifecycle Management

- ☐ Ongoing monitoring for model drift and unintended outcomes
- ☐ Defined processes for model updates, retraining, or retirement

F. Transparency & Customer Support

- ☐ Clear disclosure of AI capabilities and limitations
- ☐ Support for customer-led audits and impact assessments
- ☐ Configurable controls to meet jurisdictional requirements
